Postdoctoral researcher in applications of mathematics to biology

DIFFUSION OF THE DEAD

Knowing how long we have before we interact with a zombie could mean the difference between life, death and zombification. In this talk, I shall apply the same mathematical models to zombies that would be used to describe flu, or measles. We use this model to derive exact and approximate interaction times and use these to develop strategies which allow the human race to survive their impending doom.

Suitable for Year 11 and up.

Free to all students and to members of the LivMS. Others, £2 at the door.
